

Integration with Home Assistant

There are three options to integrate SmartEVSE with Home Assistant:

- through the HA-integration - the easy way

If you want to integrate your SmartEVSE with Home Assistant, please have a look at [the SmartEVSE custom component for Home Assistant](#). This custom_component uses the API to share data from the SmartEVSE to Home Assistant, and enables you to set SmartEVSE settings from Home Assistant. You will need firmware version 1.5.2 or higher to use this integration.

- by manually configuring your configuration.yaml

Its a lot of work, but you can have everything exactly your way. See examples in the integrations directory of our github repository.

- by MQTT

If you don't like the integration, e.g. because it only updates its data every 60 seconds, you might like to interface through MQTT; updates are done as soon as values change.... you can even mix it up by using both the integration AND the MQTT interface at the same time!
